One serial operator, nine launches, and who paid for them.

Operator TW-0120 was already in the Trenchwatch registry before this period began. In a 2.6-hour live window on pump.fun, the registry was frozen and every alert was measured afterwards against public on-chain data. This page shows what a platform would have seen.

9
alerted launches in 2.4 hours (6 from its own wallets, 3 from fresh wallets)

6.6 s
median time from launch to alert for this operator (all operators: 3.2 s)

95
outside wallets bought after the alert, with 48.4 SOL, in the first 15 s alone

+21.5
SOL net taken by the operator's wallets across the nine launches, within 6 hours

LAUNCH BY LAUNCH (UTC)

#	Time	Launched from	Alert after	Outside buyers after alert	Their SOL	Operator net SOL
L1	21:33	Fresh wallet	9.5 s	20	6.74	+6.15
L2	22:03	Own wallets	6.8 s	3	0.59	+1.03
L3	22:12	Fresh wallet	6.6 s	37	19.35	+6.62
L4	22:20	Own wallets	6.0 s	3	1.56	+1.08
L5	22:21	Own wallets	1.2 s	13	8.76	+1.63
L6	22:24	Own wallets	8.0 s	0	0.00	+4.87
L7	22:24	Fresh wallet	5.5 s	15	11.00	-0.15
L8	22:36	Own wallets	1.0 s	4	0.39	-0.82
L9	23:58	Own wallets	8.5 s	0	0.00	+1.07
	Total			**95**	**48.39**	**+21.49**

The pattern. The creator side came out ahead in 9 of 9 launches. Across all 68 alerted launches in this test, the creator came out ahead in 96% of cases, against 69% for unflagged launches with the same early activity (preliminary; being re-measured on a new period).

For an ordinary creator, a launch is a lottery. For a serial operator it is a small, repeatable gain, paid by the buyers who arrive after the bots.

What a platform could do with this, in seconds:

- Label the token as coming from a known serial operator.
- Show users a warning before they buy.
- Review the operator's other wallets and launches.

Trenchwatch sends the alert; each platform decides its own action.

HOW TO READ THIS

Public Solana data only. Addresses, never people; no user wallets are shown. Published with a delay. Operator net = SOL received minus SOL spent by the operator's wallets on each token, including network fees; it is a minimum, since wallets outside the registry and separately claimed creator fees are not counted. Outside buyers are counted only in the first 15 seconds after launch. Detection methods are not disclosed.
